WASHBASIN

INSTALLING THE WASHBASIN

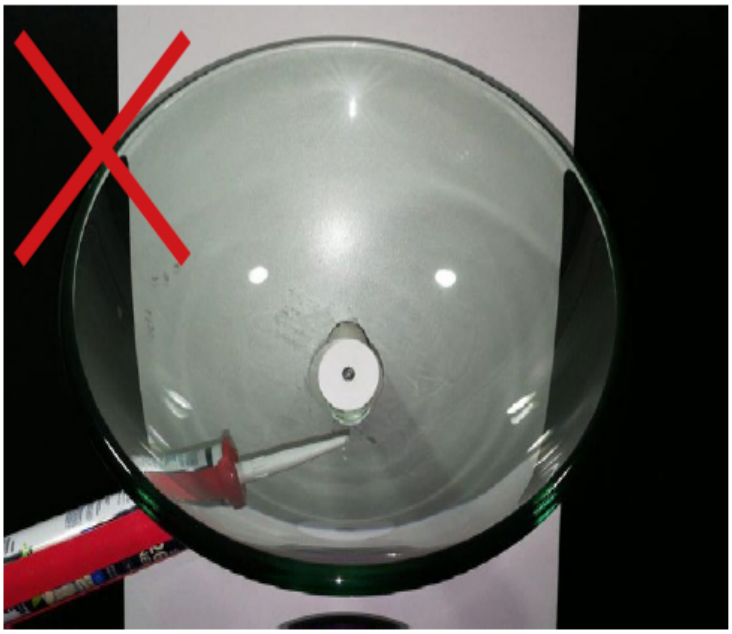

General

The washbasins sold by DUNE are decorative. The only fixing point required to secure the washbasin to the surface on which it rests is the drain valve.

The drain valve should not be overtightened when installing the washbasin. If it is too tight, it could lead to cracks appearing in the washbasin.

Glass

In the case of glass washbasins, you should not use adhesives or silicone to fix them to the base, as this may lead to the back guard breaking due to the adhesive shrinking, which would affect the finish on the visible side. DUNE will not accept any complaints about stains appearing near to the drainage area if adhesives have been used to fix the washbasin to its base.

Glass washbasins should always be handled on a level surface, and avoid subjecting them to bumps and scratches, as breaking the washbasin's back guard would affect the finish on the visible side. DUNE will not accept any complaints about problems with the finish caused by improper handling of its washbasins.

Stone

The shading of models made from stone may vary as they are manufactured using a natural product composed of veins of varying colours. This should be considered an inherent characteristic of the material which gives each washbasin a unique finish. DUNE will not accept any complaints about shading differences in stone washbasins.

Cement

As they are highly rigid, cement washbasins may crack due to rough handling, bumps or high pressure in the installation of the drain valve. Handle these products with care.

CLEANING THE WASHBASIN

It is recommended to use water, neutral soap and a soft cloth for daily cleaning. To prevent limescale stains, we recommend drying the washbasin after use.

Ceramic

These should be cleaned regularly with suitable cleaning products and rinsed with water. Do not use abrasive products to clean them, to avoid scratching the surface of the washbasin.
Repeatedly pouring away high-temperature liquids leads to stresses in the material, which may result in cracks forming to relieve the stresses. To avoid this phenomenon, DUNE advises against pouring high-temperature liquids into the washbasin or to do so gradually.

Hand-Painted Ceramics

Cleaning should be carried out gently and regularly. Use lukewarm water and a mild liquid detergent, applied with a microfiber cloth or a soft sponge, to remove soap or toothpaste residues without damaging the paint. Afterwards, rinse thoroughly and dry with a clean cloth to prevent limescale buildup. If limescale stains appear, soak a sponge with paraffin, remove the excess with absorbent paper, and gently apply it to the surface.

Important: Always avoid abrasive products or materials. Do not use stiff scouring pads, acidic cleaners, or harsh chemicals, as they may scratch or damage the handcrafted painting.

Stone

We recommend always using pH neutral cleaning products. Cleaning products with an acidic/basic pH may alter the colouring of the washbasin.

Metal

We recommend using soap and water or pH neutral products for cleaning. Do not use abrasive products to clean them, to avoid scratching the surface of the washbasin. Cleaning products with an acidic/basic pH may alter the colouring of the washbasin.

Cement

Do not pour products with a very high temperature into the washbasin, to prevent cracks from forming.
Repeatedly pouring away high-temperature liquids leads to stresses in the material, which may result in cracks forming to relieve the stresses. To avoid this phenomenon, DUNE advises against pouring high-temperature liquids into the washbasin or to do so gradually.

PVD (gold/silver finish)

We recommend using soap and water or pH neutral products for cleaning. Do not use abrasive products to clean them, to avoid scratching the surface of the washbasin. Cleaning products with an acidic/basic pH may alter the colouring of the washbasin.

Resin Sinks

Resin sinks are a delicate material, so it is recommended to clean them with non-abrasive products and sponges that will not scratch the surface. Avoid using strong acids or oxidizing agents, as they can cause damage or alterations to the material.

To remove stubborn or tough stains, follow the regular cleaning procedure, but use a soft sponge instead of a scouring pad. You can also use a white polishing compound, applying it in circular motions to restore shine without damaging the resin.

MAINTENANCE AND PROTECTION OF STONE BASINS

Natural stone basins need to be protected before installation to prevent stains. DUNE recommends using FILA products:

-Filafob to protect while maintaining the natural color of the stone.

-Filastone Plus to protect and enhance the stone’s color.

The frequency of reapplying protection depends on the type of stone, its use, and finish. You can test its effectiveness by placing a drop of water on the surface, leaving it for 15 minutes, and checking if the drop darkens the material. If it does, the stone is not well protected and needs another layer of sealant.

Maintaining stone is a simple but essential step in its care. Generally, the best cleaning product for natural stone is water. To prevent the buildup of limescale, minerals, and other residues or chemicals that may affect the stone’s surface, rinse with clean water and dry with a soft cloth.

The surface of a basin is subjected to significant wear due to frequent use. Even with regular cleaning, halos and stains may appear from constant exposure to substances and limescale deposits caused by continuous contact with water.

For the maintenance and cleaning of natural stone basins, FILACLEANER is recommended. It is a concentrated neutral detergent that cleans without damaging the stone, making it ideal for routine maintenance. Harsh chemicals such as bleach, acid-based degreasers, ammonia, and limescale removers should always be avoided.

When dealing with stains, it is essential to identify their cause to select the appropriate cleaner. DUNE recommends:

-FILAPS87: A degreasing detergent that removes stains and acts as a stripper. It cleans and degreases, making it ideal for stone cleaning. It effectively eliminates organic stains.
-FILA SR95: A color stain remover suitable even for delicate materials like polished marble, preserving the material’s shine. Effective against colored organic stains.
-FILAMARBLE RESTORER: A marble restoration kit that includes three metal pads of different grit sizes, a white polishing sponge, a shine restorer, and a nourishing cream. It is ideal for restoring small surfaces of marble, travertine, and limestone affected by acidic substances or weathering. It also removes dull spots caused by wear.

If cleaning is performed using any of these products, it is essential to dry the surface thoroughly and reapply a protective layer.

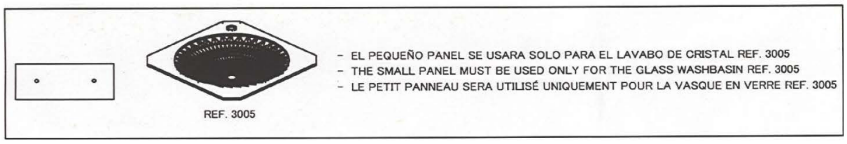

EXOTIC COUNTERTOP

The EXOTIC COUNTERTOP is made of acacia wood and comes pre-treated. To maintain the beauty and durability of the furniture, avoid using abrasive cleaning products. As an organic material, daily use and natural wear may cause slight changes in appearance over time.

It is recommended not to let water sit on the wood for extended periods to prevent stains or damage. If a stubborn stain needs to be removed, sanding the surface and applying teak oil will restore its satin finish. This hydrates the wood without sealing its pores, allowing it to breathe properly.
